TEAM A // PROJECT PRESENTATION

AI-Enhanced Ticketing System

Turning requirement docs into scoped, routed tickets — for PM/BA teams.

TEAM

- Harris Joshua Herbert
- Karthik Sekar
- Nhi Yen Dang
- Huy Minh Hoang
- Leo Antony Arul
- Hoang Mai Minh Nguyen
- Justin Tan

THE PROBLEM

Target user: PM/BA — stuck doing manual ticket admin

TARGET USER: Project Manager / Business Analyst

01

Manual breakdown

Requirement docs must be manually broken down into epics, user stories, and tasks.

02

Manual ticket creation

Stories and tasks must then be manually created on Jira or another ticketing system.

03

Manual routing

Tickets must be manually routed to the corresponding teams or developers.

THE SOLUTION

Desired feature: input in, tickets out

INPUTS

- Epic description
- Reference documentation
- Guidance / breakdown rules

AI-GENERATED OUTPUT

Auto breakdown

System automatically breaks the epic down into corresponding user stories and tasks.

Auto ticket creation

Corresponding tickets are created directly in the ticketing system.

Auto routing

Tickets are automatically routed to the necessary person in charge — testers, devs, and more.

WHY IT MATTERS

Benefits: better elicitation, less wasted time

Smarter elicitation

AI can suggest breakdown approaches or edge cases that the BA/PM might not have thought of, improving requirement quality.

Time saved

Removes the manual effort of creating tickets and figuring out routing by hand.

This AI-enhanced ticketing system removes friction for PM/BA, so they can focus on more important work.

APPROACH

How we build: two AI models, two jobs

Gemini

Technical scouting

- Used to scout the technical feasibility of ticketing system platforms (TSP).
- Evaluates which platforms and integrations are realistically viable before deeper planning begins.

Claude

Plan, implementation & testing

- Input: requirements + system architecture & logic + constraints + TSP technical feasibility (from Gemini).
- Output: proposes the plan, then drives implementation and testing.

OPEN QUESTIONS

Challenges

Reference doc + guidance

Structure & consistency

How should content be organized and structured to ensure consistent AI agent performance?

Change management

What mechanisms cope with changes throughout the SDLC?

Authorization

How should authorization be handled for AI agents?

Business

What metrics measure this product's effectiveness?

Still an open question for the team to define before rollout.

REFLECTION

Lessons learnt

“Garbage in, garbage out”

The quality of the AI's output is only as good as the requirements, reference docs, and guidance fed into it.

Planning before implementation

Time spent planning up front — architecture, logic, constraints — pays off before jumping into implementation.

Less admin. More impact.

Thank you — questions and discussion welcome.
